

The Claw - Not only a Gamecontroller

The ergonomic input device as a keyboard alternative. Especially for first person shooters as well as for complex applications (Photoshop, CAD).

Description

The most important moves for a game are attached to certain keys. When things really get hot you want to give your opponent the one last blow, but where the ... was that key...

Too late!

With the claw you have all keys right under your fingers. The [Ergonomics](#) of the claw are unsurpassed! if you have been bothered by cramps after hours of gaming the claw is just the thing for you!

The 10 keys can be programmed on 5 levels!

Instead of the unpractical and large keyboard the Claw takes up a minimal amount of space which can be important at LAN sessions. Not to speak of the jealous looks of your opponents ;-)

The Claw can be adapted to be used with office, CAD, imaging and editor programs or any other program, where often re-occurring keyboard shortcuts could come in handy.

Therefore the claw can be used in all aspects of heavy duty computing.

- Each key can be programmed to execute a certain .exe file.
- Each key can be programmed with up to 100 characters, making it possible to store addresses, macros and/or shortcuts in the Claw.
- The scrolling wheel of a mouse can be emulated.
- The mouse buttons can be emulated.
- The setup can be exported to be shared amongst users.

Summing it all up:

- Ergonomic
- Fast
- Deadly!

Specification

Mechanical data

Housing:

Housing: Plastic

Color: black

Dimensions: 136 x 193 x 45 mm

Cable Length: 200 cm

Keys

Key Technology: short travel key

Number of Keys: 10

Electric Data

Interface: [USB](#)

Operating Voltage: 5 V
